Geekbench 7 Introduces New Multi-Core and GPU Benchmarks

Description

Primate Labs has launched Geekbench 7. This is a new version of its software that tests CPU and GPU performance.

The new Geekbench 7 includes a redesigned multi-core benchmark. This means it better shows how applications work in real life. The tests will only run in multi-threaded mode if the task also runs that way in real applications. This will give a more accurate score for how well a device performs.

Geekbench 7 also has updates for the GPU benchmark. This tests how GPUs are used today, especially for machine learning and creating content. The new GPU tests can track faces and apply effects to video in real-time. They can also upscale images and blur backgrounds during video calls.

Additionally, Geekbench 7 uses more complex data to show how people use their computers. It includes new media tests for audio and video processing. It also has a Game Physics test based on popular video games.

Geekbench 7 is available for iOS, macOS, and other platforms. It is free for personal use. The Pro version is discounted until August 6.
