

Leaked Photo Reveals iPhone 17 Air with Rear Camera Bar

Description

A notorious informant by the name of “Majin Bu” recently divulged an alleged image of a component purportedly belonging to the fabled, razor-thin “iPhone 17 Air” model. The obscure, pixelated depiction showcases a pair of rear iPhone casings featuring a pill-shaped, elevated camera bar at the pinnacle. Positioned on the left side of the bar is a circular orifice seemingly designated for a solitary rear camera, while on the right side, one can discern the presence of an LED camera flash and a diminutive microphone orifice. Evidently, the ultra-slim “iPhone 17 Air” is anticipated to sport a solitary rear camera, thus indicating that the shell in question may pertain to this specific variant.

Conversely, reports suggest that the fourth-generation iPhone SE may also boast a solitary rear camera, although there have been no whispers of an elongated camera ridge for the said device. In the realm of AI-generated visuals and counterfeit iPhones, deciphering the authenticity of such leaks proves to be an arduous task. While some leaks materialize into reality, many are debunked as fabrications. Therefore, exercising caution and skepticism remains imperative.

Majin Bu, renowned for accurately predicting the “Desert Titanium” color moniker for iPhone 16 Pro models months before their release, has occasionally disseminated inaccurate information, such as a baseless speculation surrounding an imminent iPad 11 launch in 2023. Anticipation looms surrounding the purported elongated camera bump slated for both the “iPhone 17 Air” and iPhone 17 Pro iterations, hinting at a potential design overhaul across the entire iPhone 17 range. Apple is primed to unveil the iPhone 17, “iPhone 17 Air,” iPhone 17 Pro, and iPhone 17 Pro Max this September.

Echoing insights from Apple analyst Ming-Chi Kuo, the “iPhone 17 Air” is projected to measure a mere 5.5mm at its slimmest juncture, thereby paving the way for it to become the thinnest iPhone iteration to date. Notably, Apple refrains from incorporating the rear camera bump in its official iPhone dimensions. Owing to its slender profile, the “iPhone 17 Air” is anticipated to feature modest specifications, encompassing a lone rear camera, a solitary speaker, a universal absence of a SIM card slot, and an A19 chip as opposed to the more robust A19 Pro variant. Furthermore, the device is likely to house a diminished battery capacity relative to its counterparts due to spatial constraints.

Additional rumored attributes comprise a 6.6-inch OLED display augmented with a Dynamic Island, Face ID functionality, 8GB of RAM tailored for Apple Intelligence support, among other enhancements. Stay abreast of the latest rumors concerning the iPhone 17 by bookmarking our comprehensive iPhone 17 roundup.
