

Microsoft Releases Windows 11 Update to Boost PC Performance

Description

Microsoft is releasing a new update for Windows 11 called KB5089573. This update aims to improve the speed and reliability of using your PC. The changes are part of a project called Windows K2, where Microsoft focuses on making Windows 11 better based on user feedback.

The update promises faster app launches and improved experiences for features like the Start menu, Search, and Action Center. Microsoft also says it makes signing in, using File Explorer, and changing themes more reliable, especially for touchscreen devices.

Microsoft has tested these improvements with users and noted real performance gains. The "Low Latency Profile" feature allows the CPU to work at higher speeds for brief periods. This helps tasks, such as opening applications, become significantly faster—up to 40% quicker in some cases.

The update will not show immediate results for everyone. Performance gains will roll out gradually over the next weeks. Along with speed improvements, the update introduces features like sharing Bluetooth connections with two devices and updates to Task Manager.

To install the KB5089573 update, go to Windows Settings, then Windows Update, and select Optional updates. Users can also enable automatic updates to ensure they receive new features quickly.
