

Scientists have made progress towards understanding the mystery of the sun's magnetic field

Description

Join CNN's Wonder Theory science newsletter for the latest updates on fascinating discoveries and scientific advancements in the universe.

The sun's powerful magnetic field creates sunspots and solar storms, as seen in the recent auroras that illuminated the planet. Astronomers have long been puzzled about how this magnetic field is generated within the sun, with new research suggesting it originates closer to the surface than previously thought.

This new theory could lead to better understanding of the 11-year solar cycle and improved space weather forecasting, crucial for GPS and communication satellites. Researchers believe that the number of sunspots reflects the strength of the sun's magnetic field, helping predict the intensity of future solar activity.

By studying torsional oscillations and developing new numerical algorithms, scientists have made significant progress in unraveling the complexities of the sun's magnetic field. Their findings have been met with intrigue and could shape future research in this field.
