

Subterranean Oceans: Mars Holds Vast Water Reserves

Description

Scientists discovered water beneath the surface of Mars using data from a NASA mission. The water is trapped in rocks deep underground and could fill oceans on Mars. The finding sheds light on Mars' geological history and a potential new habitat for life.

The data came from NASA's InSight lander, studying Mars from 2018 to 2022. The water, located 7-12 miles below the surface, poses challenges for future Mars exploration. However, it offers insights into Mars' past as a warmer, wetter planet.

The underground water reservoir could sustain life if accessed. InSight's data revealed the water likely filtered into the Martian crust. This discovery marks a significant step in understanding Mars' evolution and potential habitability.

The research suggests a deep layer of volcanic rock filled with liquid water on Mars. This finding opens up possibilities for future exploration and understanding of Mars' unique geology.
